**Abstract:**

This article deals with the implementation of a new version of a macroeconomic regional growth model called MACroeconomic, Sectoral, Social, Territorial Model (MASST). The new version presents interesting novelties with respect to the past, since it is able to embrace the two main supranational regulations with which the European Union binds decision-making processes in national economies, that is, public budget limitations and austerity measures on the one hand, and competitiveness/growth measures on the other hand.
